# Recent Advances in Assessing Time Series Similarity Through Dynamic Time Warping Geoff Webb Monash University http://i.giwebb.com Work with C. W. Tan, M Herrmann & F. Petitjean

#### Outline

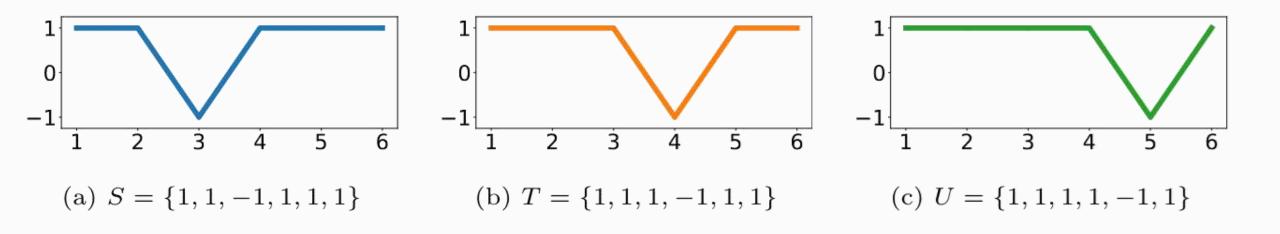

- Similarity assessment for time series
  - > Dynamic Time Warping (DTW)
- Fast DTW computation
  - Early abandoning and pruning
- DTW variants
  - Cost function tuning
  - > Amerced Dynamic Time Warping

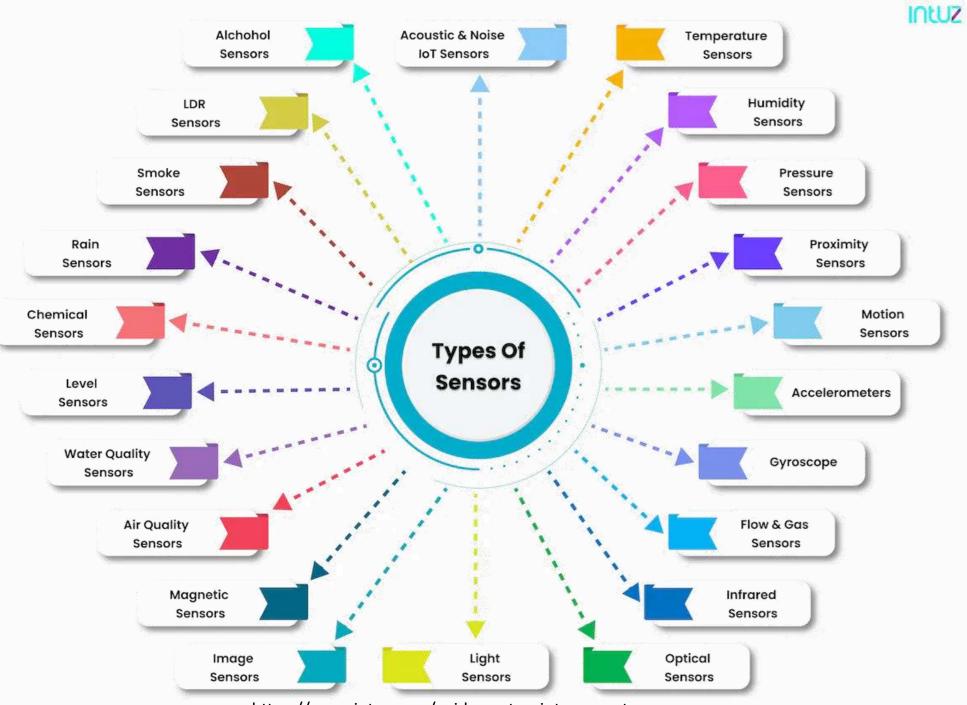

# Time series

#### Time series

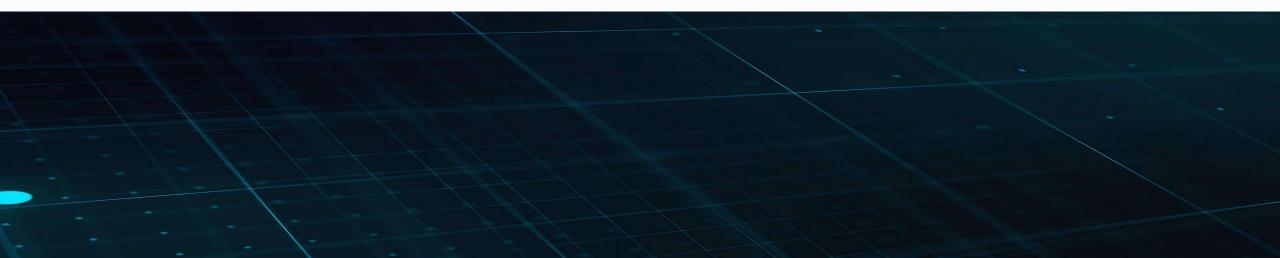

https://www.intuz.com/guide-on-top-iot-sensor-types

#### Applications

- Finance
- Health
- Environmental monitoring
- Equipment monitoring and control
- Process monitoring and control
- Online systems
- Logistics

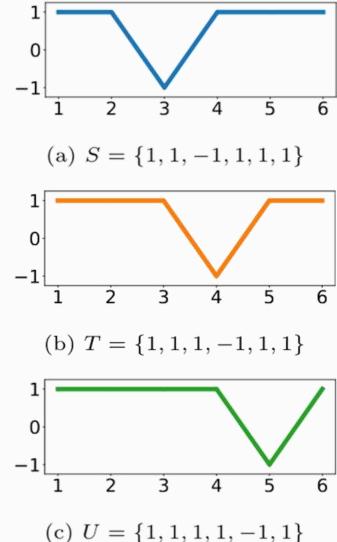

# Similarity assessment for time series

# Similarity assessment is foundational for data science

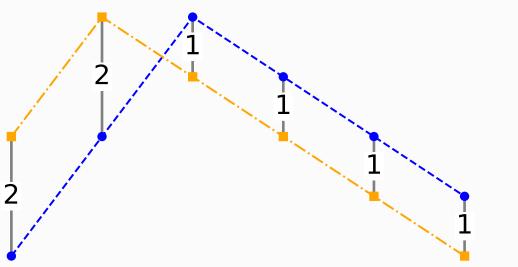

#### Underpins

- Classification
- > Regression
- Clustering
- Anomaly & outlier detection
- Sequence alignment
- Recommender Systems
- Feature extraction
- Information retrieval

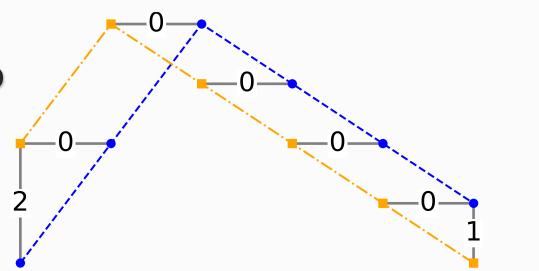

#### Time series distance measures

- Assess similarity in terms of *distance* between series
- Direct Alignment sums differences between points at same time step

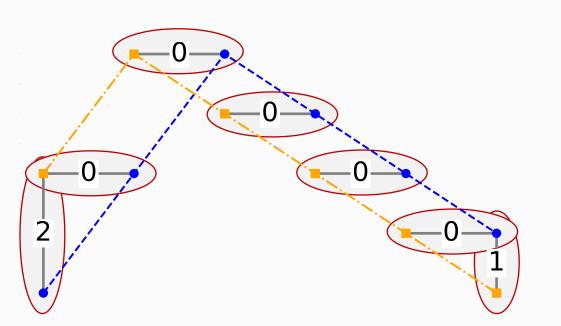

#### Time series distance measures

- Assess similarity in terms of *distance* between series
- Direct Alignment sums differences between points at same time step
- Dynamic Time Warping allows alignments across time steps

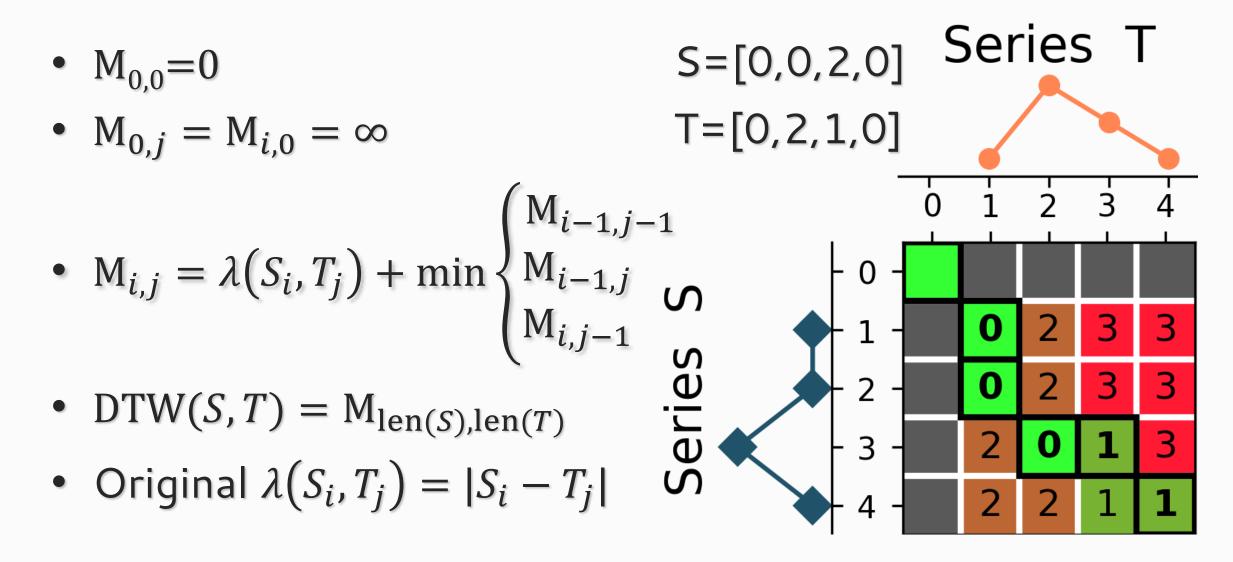

#### Dynamic Time Warping (DTW)

- Popular distance measure for time series
- First points are aligned
- Last points are aligned
- Successive alignments advance by at most one time step along each series

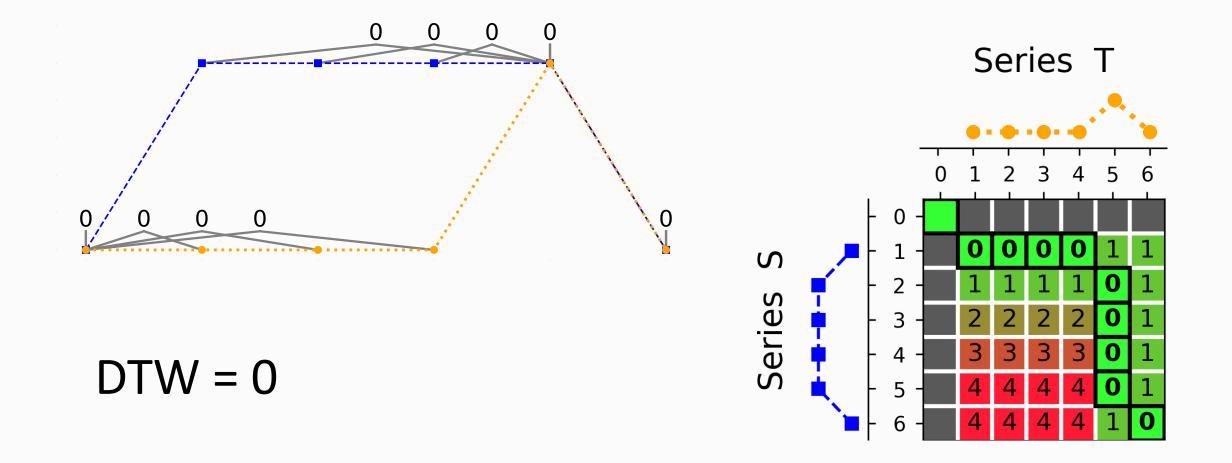

Distance = minimum cost path that satisfies these constraints

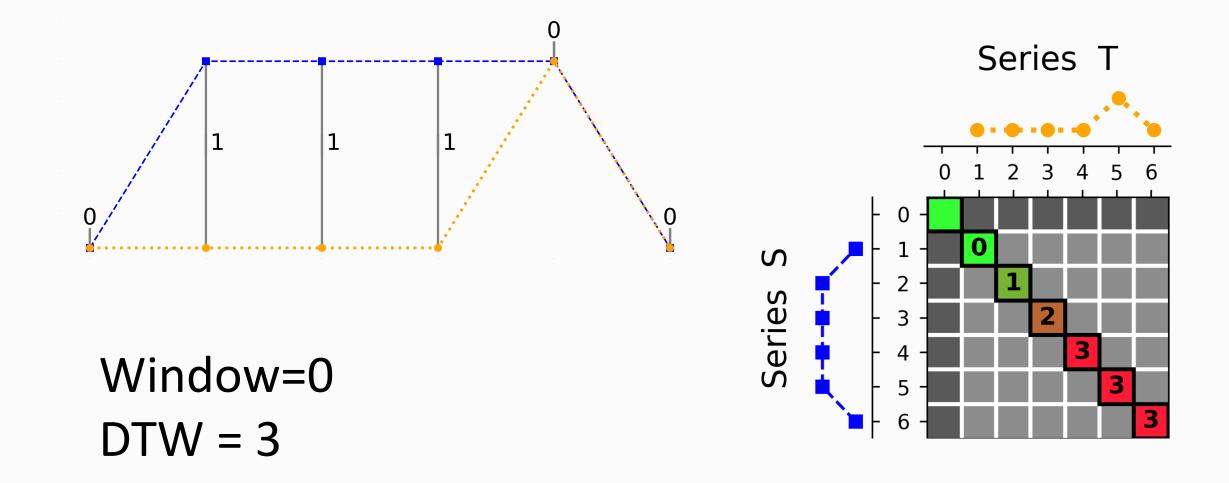

#### Dynamic programming calculates DTW efficiently

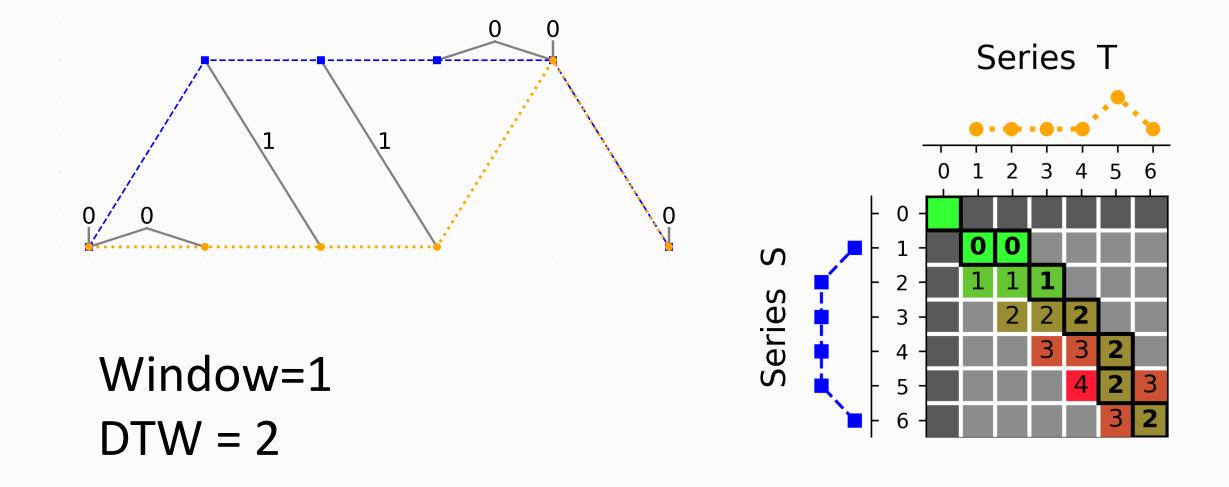

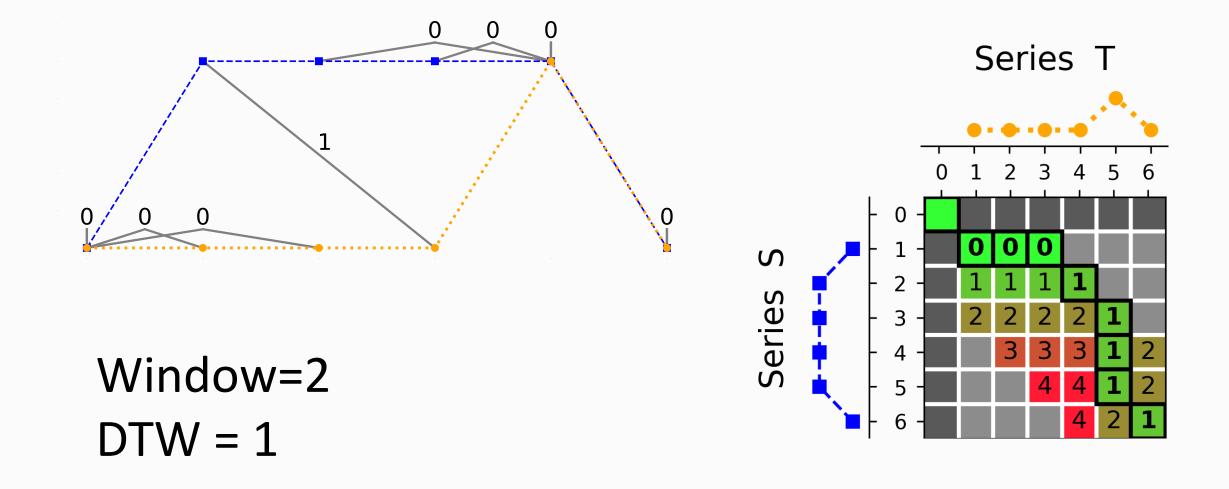

DTW's warping can be too permissive

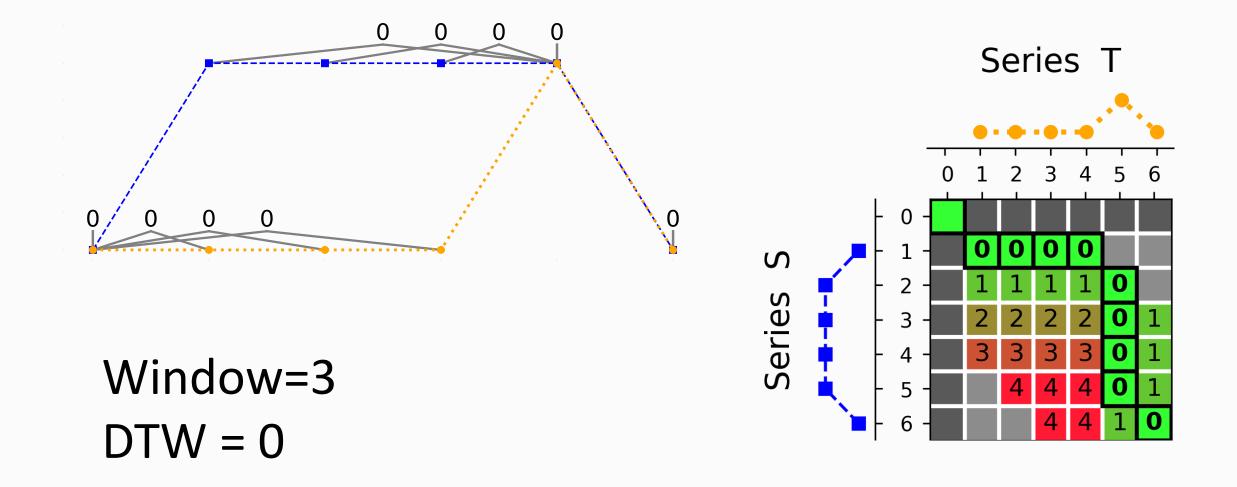

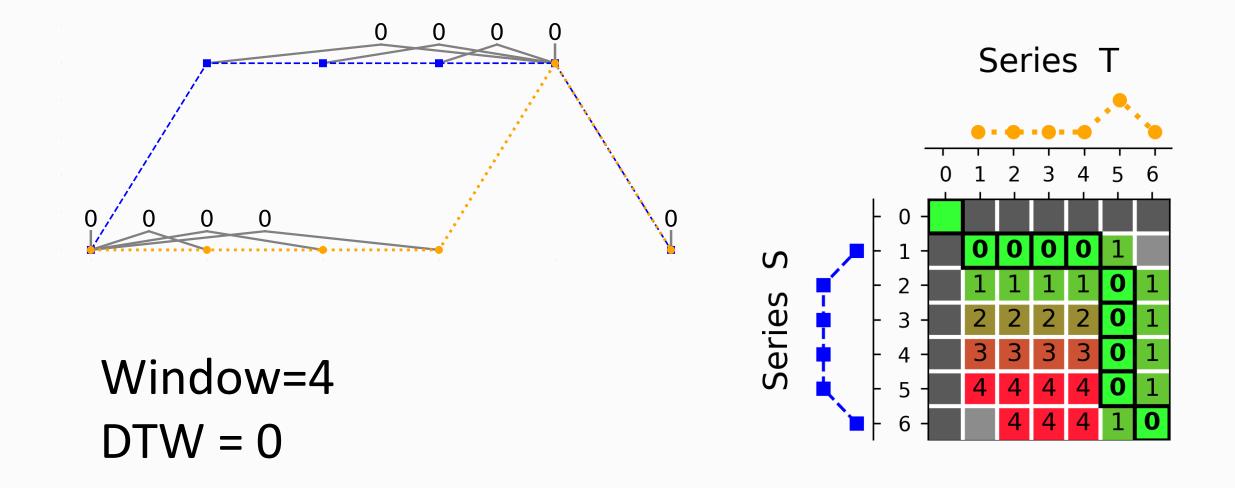

- Adds further constraint: points cannot be aligned if separated by more than WINDOW time steps
- Distance is path with minimum cost that obeys constraints

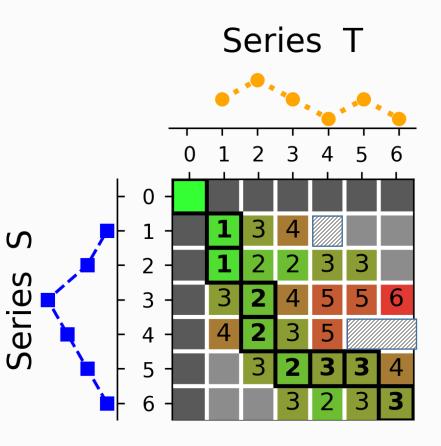

# Fast DTW computation

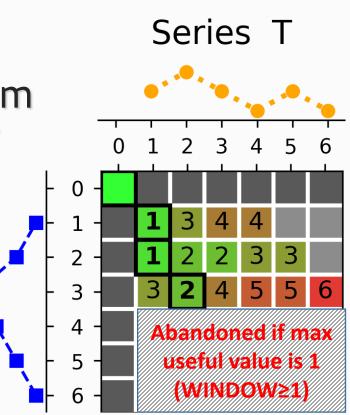

#### Fast DTW computation

- Naïve approach must fill the entire matrix
  - $\succ$  O(len(S) × len(T))
- Pruning: Given a maximum useful value, skip computation of cells that are on paths that exceed that value
  - Either cost of direct alignment path or an external factor such as the distance to the closest neighbour found so far

#### Fast DTW computation

- Naïve approach must fill the entire matrix
  - $\succ$  O(len(S) × len(T))
- Early Abandoning: Given a maximum useful value, abandon computation if all paths exceed that value

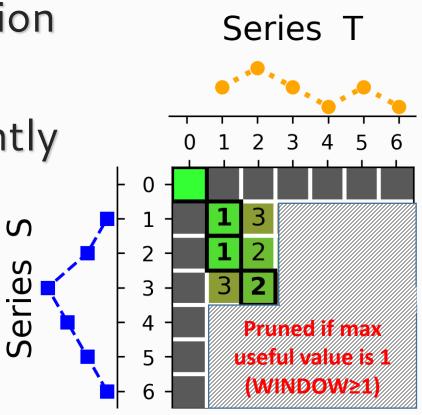

S

S

Ser

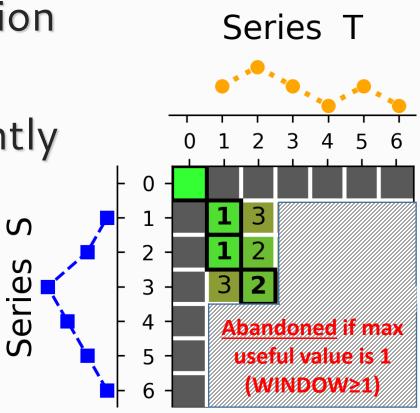

#### Our Method Early Abandoning AND Pruning

- Based on realization that when all paths are pruned the computation should be abandoned.
- Implements pruning more efficiently than previous approaches
- Unlike previous approaches, achieves abandoning without any significant computational overhead

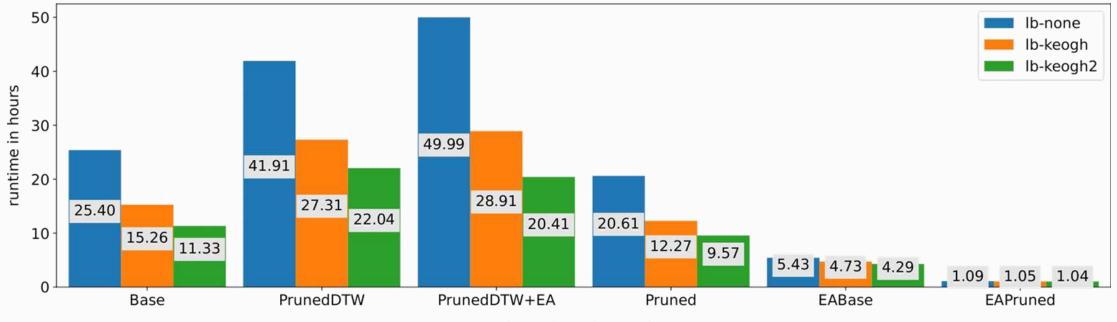

#### Our Method Early Abandoning AND Pruning

- Based on realization that when all paths are pruned the computation should be abandoned.
- Implements pruning more efficiently than previous approaches
- Unlike previous approaches, achieves abandoning without any significant computational overhead

# Cost function tuning

#### Cost function tuning

- The cost function determines the penalty for each alignment of two points 2.00  $\gamma = 0.5$  $\gamma = 2.5$
- The original cost function was  $\lambda(S_i - T_j) = |S_i - T_j|$
- $\lambda(S_i T_j) = (S_i T_j)^2$  also popular
- We explore

$$\lambda_{\gamma}(S_i - T_j) = |S_i - 0.05 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.25 | 0.50 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.75 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.$$

#### Distances using $\lambda(S_i - T_j) = |S_i - T_j|$

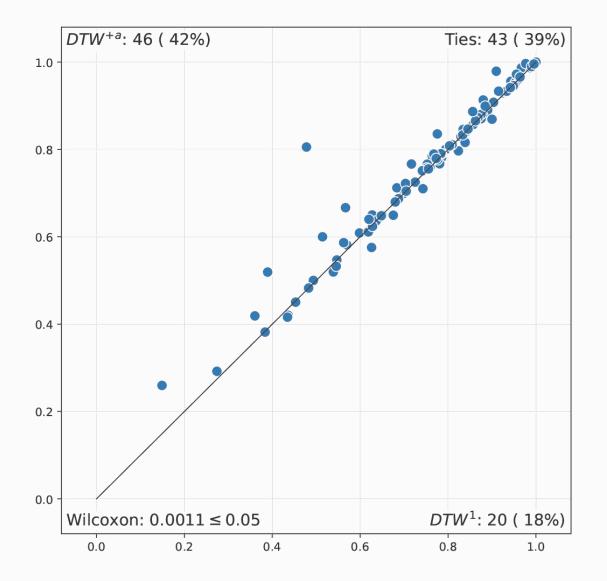

## Distances using $\lambda(S_i - T_j) = (S_i - T_j)^2$

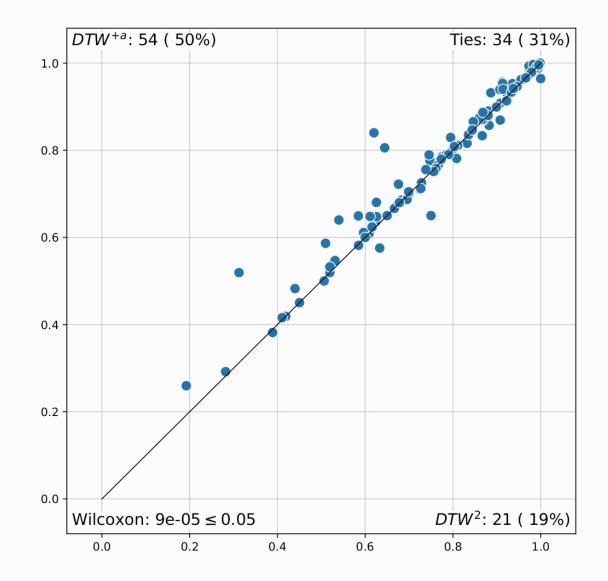

# Distances using $\lambda_{\gamma}(S_i - T_j) = |S_i - T_j|^{0.5}$

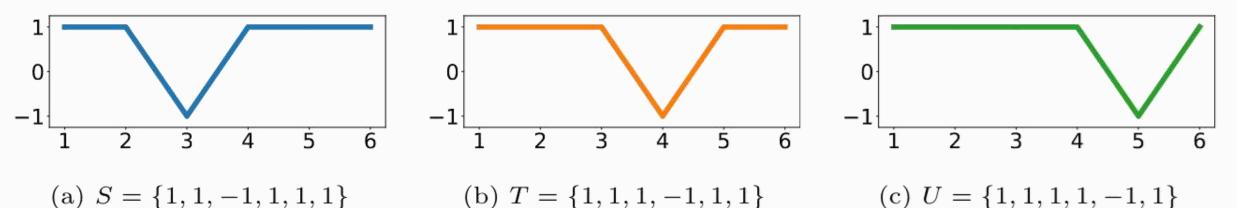

#### Cost tuning against fixed cost - UCR

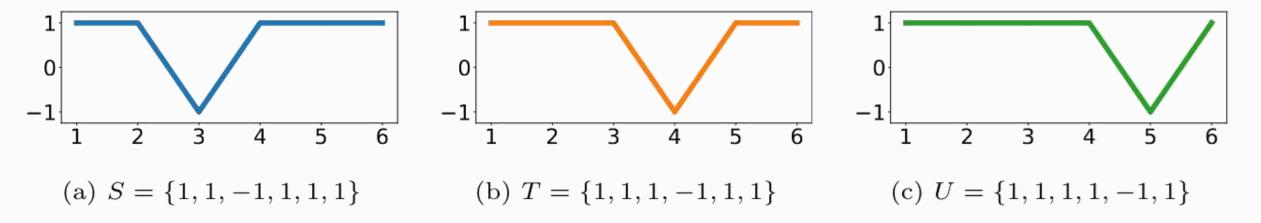

# Amerced Dynamic Time Warping

Amerced Dynamic Time Warping (ADTW)

- Intuitively S closer to itself than T, and S closer to T than U dist(S,S) < dist(S,T) < dist(T,U)</li>
- With  $DTW_{\infty} = DTW$  with no window, we have  $DTW_{\infty}(S,S) = DTW_{\infty}(S,T) = DTW_{\infty}(S,U) = 0$
- With DTW, we have a "step function"
  - $w \ge 2$ , DTW(S,S) = DTW(S,T) = DTW(S,U)=0
  - w = 1, DTW(S,S) = DTW(S,T) = 0 < DTW(S,U) = 8
  - w = 0, DTW(S,S) = 0 < DTW(S,T) = DTW(S,U) = 8

 New distance ADTW with additive penalty omega ω ω=0, ADTW(S,S) = ADTW(S,T) = ADTW(S,U)
0<ω<4, ADTW(S,S) < ADTW(S,T) < ADTW(S,U)</li>
ω≥4, ADTW(S,S) < ADTW(S,T) = ADTW(S,U)</li>

#### DTW

- $M_{0,0} = 0$   $M_{0,j} = M_{i,0} = \infty$

#### ADTW

• M<sub>0,0</sub>=0

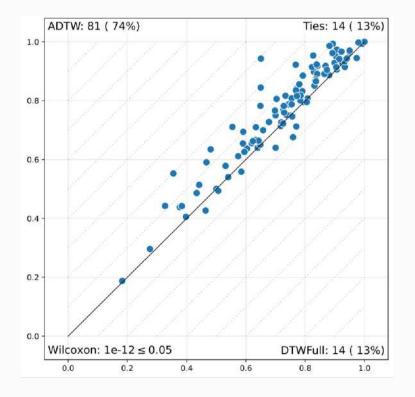

• 
$$M_{0,j} = M_{i,0} = \infty$$

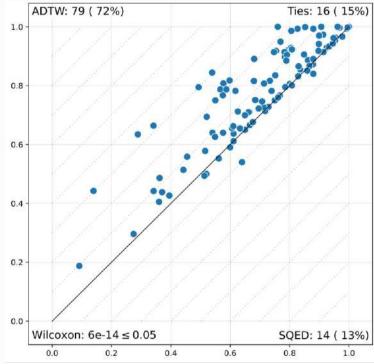

• 
$$M_{i,j} = \gamma(S_i, T_j) + \min \begin{cases} M_{i-1,j-1} \\ M_{i-1,j} \\ M_{i,j-1} \end{cases}$$
 • 
$$M_{i,j} = \gamma(S_i, T_j) + \min \begin{cases} M_{i-1,j-1} \\ M_{i-1,j} + \omega \\ M_{i,j-1} + \omega \end{cases}$$

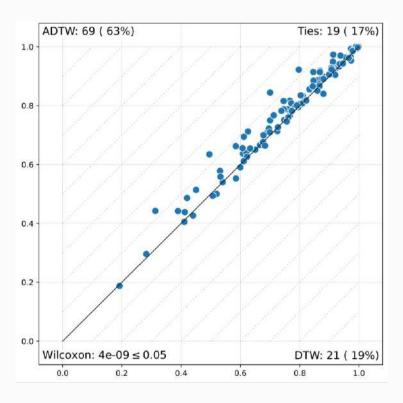

#### **ADTW** properties

- Symmetric: ADTW(S,T) = ADTW(T,S)
- ADTW(S,T) = ADTW(reverse(S), reverse(T))
- Monotonic with respect to  $\boldsymbol{\omega}$
- $ADTW_0(S,T) = DTW_{\infty}(S,T)$
- $ADTW_{\infty}(S,T) = DTW_{0}(S,T)$
- So with  $0 \le \omega \le \infty$  we have DTW<sub> $\infty$ </sub>(S,T)  $\le$  ADTW(S,T)  $\le$  DTW<sub>0</sub>(S,T)

#### Comparison with DTW

ADTW vs  $\mathrm{DTW}_\infty$ 

ADTW vs DTW<sub>0</sub>

ADTW vs DTW<sub>w</sub>

# Concluding remarks

#### **Research opportunities**

- How to select meta parameters for tasks like clustering without objective performance measures
  - > w for DTW
  - $\succ \omega$  for ADTW
  - Cost function for all DTW variants
- Other classes of cost function
- Evaluate cost function tuning and ADTW in other tasks

#### Conclusions

- EARLY ABANDONING AND PRUNING supports very fast exact calculation of DTW and its variants
- COST FUNCTION TUNING can greatly improve DTW utility
- ADTW is an effective alternative to windowing for constraining warping in DTW
- We believe in reproducible research: 📚 🖌
